## Analysis of Barriers and Possibilities

A circular construction sector is one in which every part of the process of deciding, designing, and constructing new buildings is rethought to include exploiting the value of the materials already present in the built environment and ensure that the buildings designed and built today can maintain their value in the future, either as buildings, or in their constituent components. A report including an analysis of barriers and possibilities was published as a part of work package 2. **The full report is available on the Nordic Council of Ministers' publishing platform.**

This report explores the current state of and framework conditions for the development of a circular construction sector in the Nordic countries, and through consultation with the construction value chain, it identifies barriers that limit the transition to and opportunities that could be exploited to support a more circular approach in the circular construction industry. A main takeaway from the analysis of these barriers is that they are heavily interlinked. For example, lack of

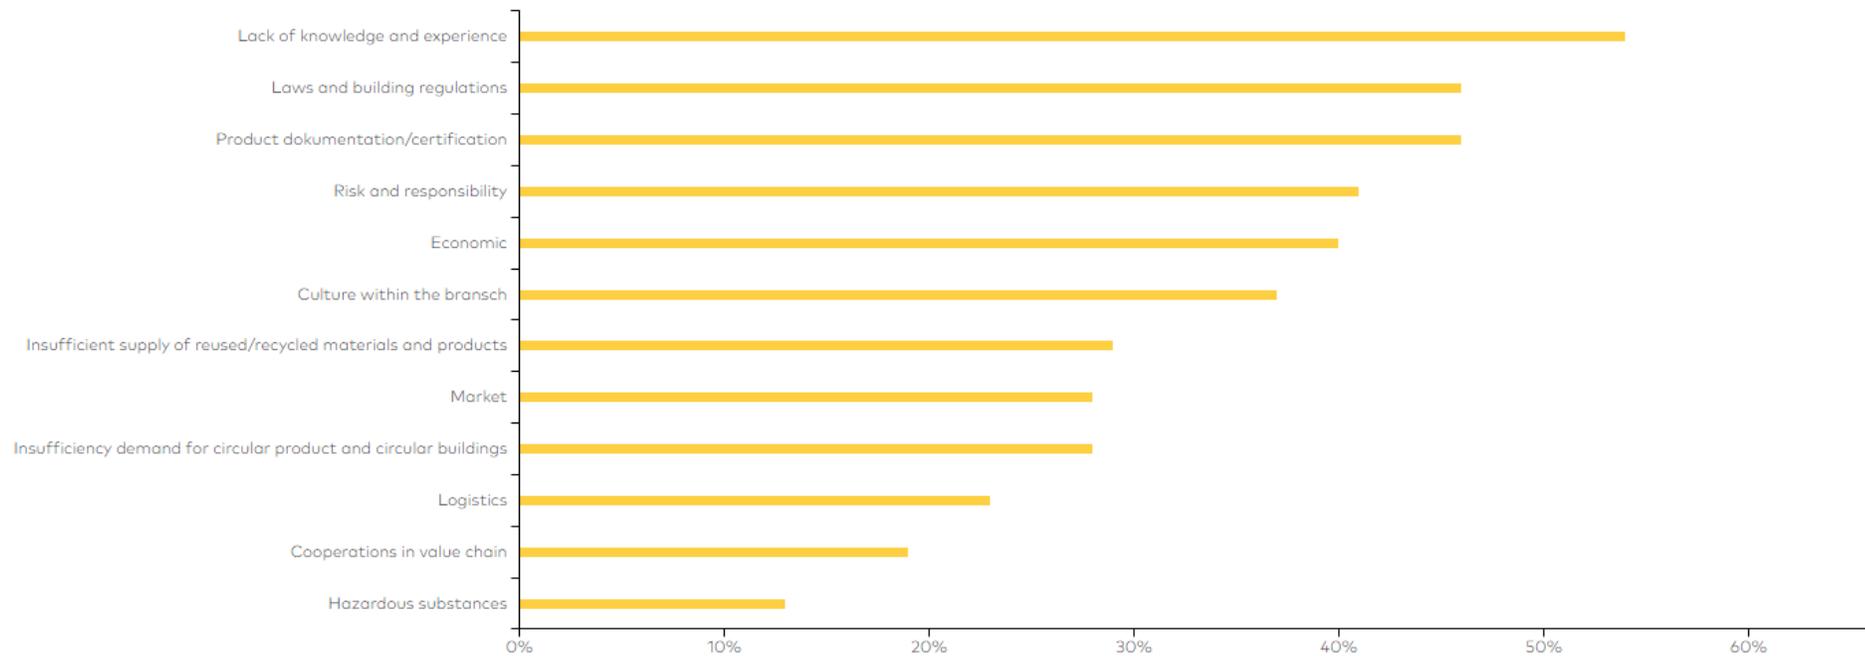

Figure 7 – Survey results - Barriers to circular construction

# 1

## BARRIER 1: LACK OF KNOWLEDGE & EXPERIENCE

Actors along the value chain do not have sufficient knowledge or experience of the methods, processes or routines required for Circular Construction.

### OPPORTUNITIES

- **Pilot projects**  
Enable new actors to enter the circular construction market under favourable conditions, build experience, and develop and test new methods for all phases of circular construction.
- **Networks**  
Provide a meeting place for interested actors to expand their network and learn new competencies.
- **Knowledge centres**  
Provide central hubs that collect, collate, and communicate knowledge, experience, and best practices on circular construction.
- **Educational materials**  
Provide standardised learning within the sector, both through tertiary education and training, as well as apprenticeship training and education.

## **Developers & Owners**

Developers and owners can help overcome the lack of knowledge and experience as well as any economic and cultural challenges by taking the lead and commissioning CC projects, and by including induced benefits in calculations. They can help overcome risk and responsibility challenges by engaging with the value chain to develop new negotiated responsibilities. To do so, they should plan for a long-term future, embed CC at the start of the process, and support the CC process by synchronising construction and demolition activities.

## **Architects, engineers and consultants**

Architects, designers, and engineers can support developers in the move toward CC by proposing and developing CC solutions, supporting the negotiation of risks and responsibilities, and developing new norms for sourcing more sustainable and/or reused materials. They can also work on integrating CC into existing tools and methods and supporting the integration of CC into existing certification frameworks, all with the clear goal of narrowing, slowing, and closing cycles.

## **Construction Companies**

Construction companies can support the transition to CC and reduce the knowledge and experience gap by engaging with their peers and learning from pilot projects, not least by collaborating with

What is clear from the mapping of the barriers is that they are heavily interlinked and often reinforcing. For example:

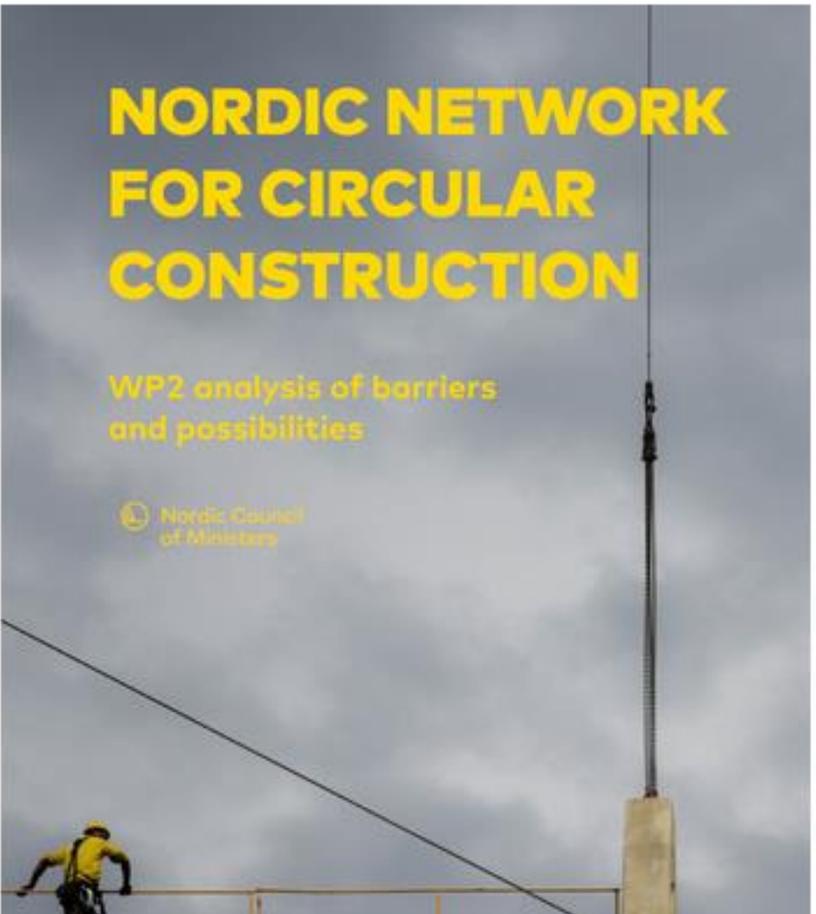

- Lack of experience and knowledge within the sector stems from a lack of opportunity to gain that experience and knowledge, while that same lack of experience and knowledge means that it is difficult to commission projects with a circular focus. Lack of experience and knowledge also leads to longer project time frames and therefore higher expenses.
- Lack of documentation leads to uncertainty about the quality and safety of products and buildings, so the allocation of responsibility becomes a key challenge, which is itself hampered by a lack of experience within the value chain for addressing responsibility in new ways.
- The supply of products for reuse is hampered by the lack of knowledge and experience in terms of disassembly for reuse along with the additional costs associated with these practices and the lack of demand for reused products. The lack of demand for reused products stems at least in part from the uncertainty regarding supply and again about the potential for additional and potentially unknown/hidden costs.

## Analysis of Barriers and Possibilities

A circular construction sector is one in which every part of the process of deciding, designing, and constructing new buildings is rethought to include exploiting the value of the materials already present in the built environment and ensure that the buildings designed and built today can maintain their value in the future, either as buildings, or in their constituent components. A report including an analysis of barriers and possibilities was published as a part of work package 2. **The full report is available on the Nordic Council of Ministers' publishing platform.**

This report explores the current state of and framework conditions for the development of a circular construction sector in the Nordic countries, and through consultation with the construction value chain, it identifies barriers that limit the transition to and opportunities that could be exploited to support a more circular approach in the circular construction industry. Theory of change	
Process	<input checked="" type="checkbox"/>
Output	<input checked="" type="checkbox"/>
Outcome	<input checked="" type="checkbox"/>
Impact	<input checked="" type="checkbox"/>

CE Strategy	
<b>1) Function</b> Refuse (R0), Rethink (R1), Reduce (R2)	<input checked="" type="checkbox"/>
<b>2) Product</b> Reuse (R3), Repair (R4), Refurbish (R5), Remanufacture (R6)	<input checked="" type="checkbox"/>
<b>3) Component</b> Reuse (R3), Repurpose (R7)	<input checked="" type="checkbox"/>
<b>4) Material</b> Recycle, downcycle (R8)	<input checked="" type="checkbox"/>
<b>5) Embodied Energy</b> Recover (R9)	<input checked="" type="checkbox"/>
<b>6) Reference</b> e.g. waste generation	<input checked="" type="checkbox"/>

**HOW TO USE THE DASHBOARD**

Select the inclusion filters you want to apply to the database. The more filters, the more results. If in doubt, select all filters in the category. If no filters are applied to one category, no results will show.

Results will show below as indicator, unit and RACER score.

Read about each variable on the first sheet named "START HERE".

RACER score minimum threshold	
= 5	<input checked="" type="checkbox"/>
≥ 4	<input checked="" type="checkbox"/>
≥ 3	<input checked="" type="checkbox"/>
≥ 2	<input checked="" type="checkbox"/>
≥ 1	<input checked="" type="checkbox"/>

Who is measuring	
Policy makers / Procurers / Public authorities	<input checked="" type="checkbox"/>
Built Environment and Sustainability professionals	<input checked="" type="checkbox"/>

**FILTERING RESULTS:** 243 indicators

INDICATOR:	UNIT:	RACER score:
Academic Laboratories involved with research on CE (or sustainability in regard to CE) in the C&D sector (e.g., research in buildings design for CE, research on innovative building materials)	no.	2,8
Accessability for recycling	score	3
Adaptability and flexibility in new buildings	score	3
Adoption of circular business model	scale	1,6
Amount of unrecoverable CDW.	tonnes	3

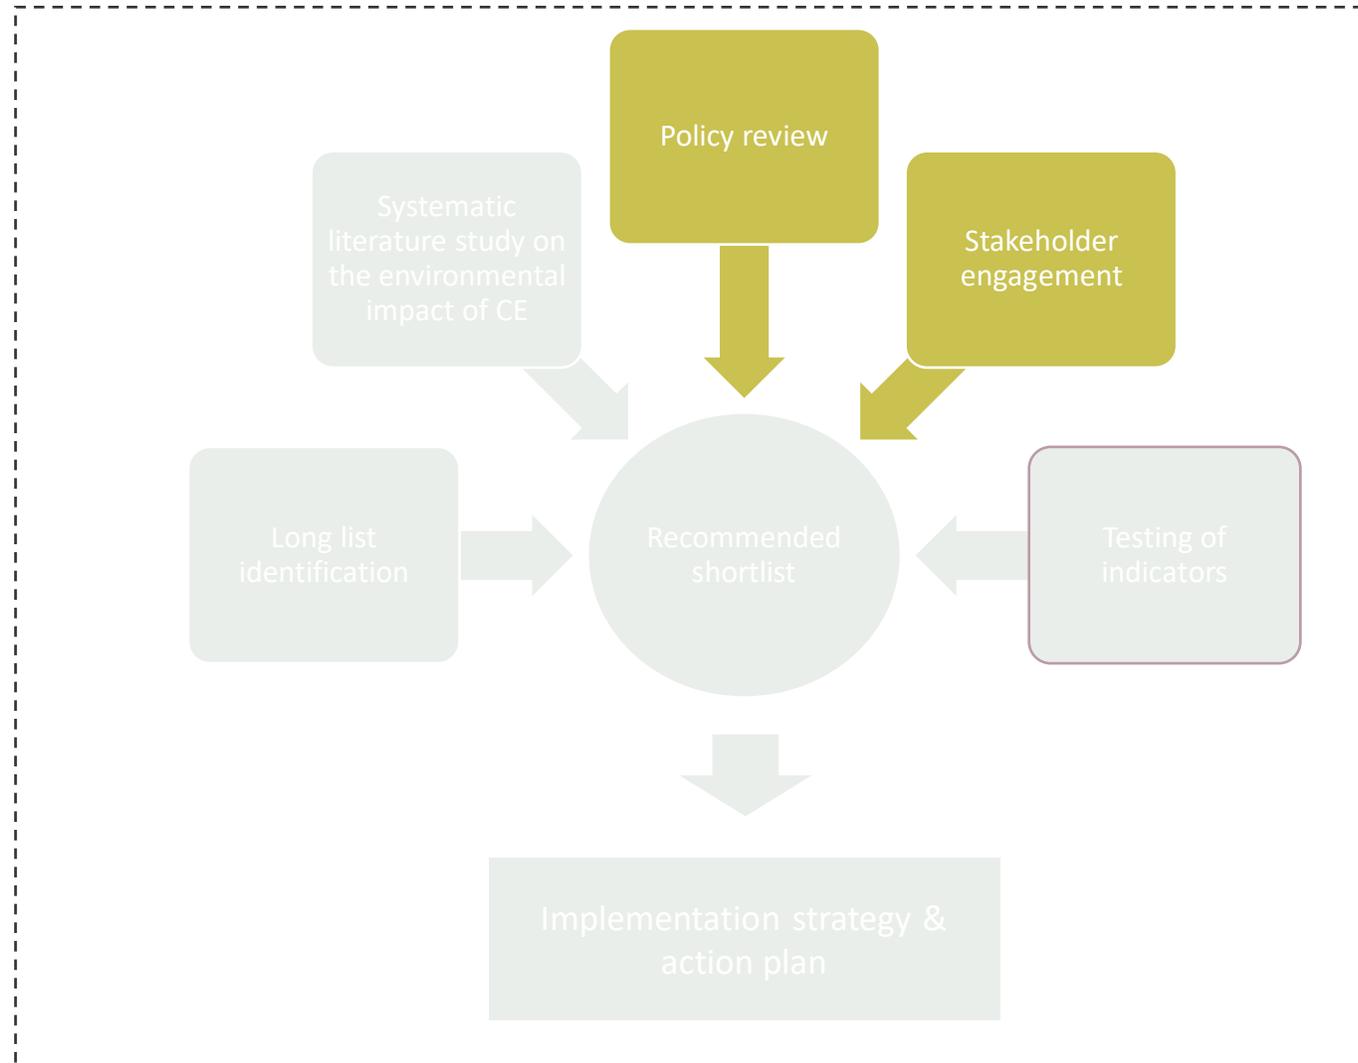

## KESKEISET HAVAINNOT KIRJALLISUUSKATSAUKSESTA (1/2)

1. Mahdollisuutta lieventää rakentamisesta aiheutuvia haitallisia vaikutuksia ekosysteemipalveluihin ja biologiseen monimuotoisuuteen kiertotalouden strategioiden avulla ei ole vielä laajasti ja systemaattisesti tutkittu vertaisarvioituissa artikkeleissa.
2. Kokonaisuudessaan yhteys kiertotalouden ja ympäristön välillä mainitaan vain epäsuorasti. Merkittävin potentiaali on hiilipäästöjen, resurssien louhinnan, antroposentrisen maankäytön ja kaatopaikkajätteen vähentämisessä.
3. Suurin osa artikkeleista käsittelee vain kierrätystä. Joissakin artikkeleissa mainitaan uudelleenkäyttö, korvaaminen ja vähentäminen, mutta muita kiertotalouden strategioita ei käsitelty arvioitavissa artikkeleissa.
4. Kiertotalouden ympäristöön kohdistuvan paineen pienennyspotentiaali on yleinen käsitys, joka ei näytä vaativan perusteluja tai viitteitä. Se mainitaan usein artikkeleiden johdanto-osissa.
5. Kiertotalouden strategioiden ympäristöpaineen lieventämisen aste riippuu useista paikallisista tekijöistä, mukaan lukien olemassa oleva maankäyttö ja maanpeite, sekä lajien ja elinympäristöjen toiminnallinen vastaavuus, joita vaikutukset koskevat.

## KESKEISET HAVAINNOT KIRJALLISUUSKATSAUKSESTA (2/2)

6. Kemikaaleilla on tärkeitä toiminnallisuuksia rakentamisessa. Ne kuitenkin muodostavat uhan kiertotalouden siirtymälle, koska niitä on vaikea dokumentoida ja seurata kiertotaloudessa, ja samaan aikaan ne aiheuttavat vaaraa biodiversiteetille, ekosysteemeille ja ihmisten terveydelle.
7. Joitakin mahdollisia indikaattoreita rakentamisen biodiversiteettivaikutusten mittaamiseksi ovat
  - ❖ raaka-aineiden tarve (RMR),
  - ❖ maankäyttö ja
  - ❖ biodiversiteetin häviämisen indeksi.
8. Katsauksemme viittaa siihen, että kiertotaloudessa keskitytään tällä hetkellä usein materiaalitehokkuuteen luonnonsuojelun sijaan. Uusiutumattomien resurssien korvaamisessa uusiutuvilla on otettava huomioon, että nykymuotoinen metsäteollisuus asettaa jo merkittävää painetta ekosysteemeille Pohjoismaissa.
9. Jos kiertotalouden strategioita toteutetaan ainoastaan materiaalitehokkuuden näkökulmasta, ottamatta huomioon ekosysteemien ja biologisen monimuotoisuuden säilyttämistä ja hallintaa tai heijastusvaikutusten riskiä, on epätodennäköistä, että biodiversiteettikriisi pysähtyisi. Kirjoittajat esittävät kierto- ja biotalouden yhdistelmää parempana ja palauttavampana vaihtoehtona, jolla toteuttaa luonnollisten elinympäristöjen kestävä hallintaa.

# MITÄ SIDOSRYHMÄT KATSOVAT OLENNAISEKSI SEURATA

- *mitä ihanteellisesti tulisi seurata,*
- **mitä sidosryhmät katsovat olennaiseksi seurata**
- *mitä voidaan realistisesti valvoa*

# PARADIGM-SHIFT IN EU

Shift from focus on energy in the use phase to a life cycle perspective

Revision of existing legislation, mainly the CPR and Waste Framework Directive

**Focus on reporting:**

Taxonomy: activities, finance

CSRD: social responsibility

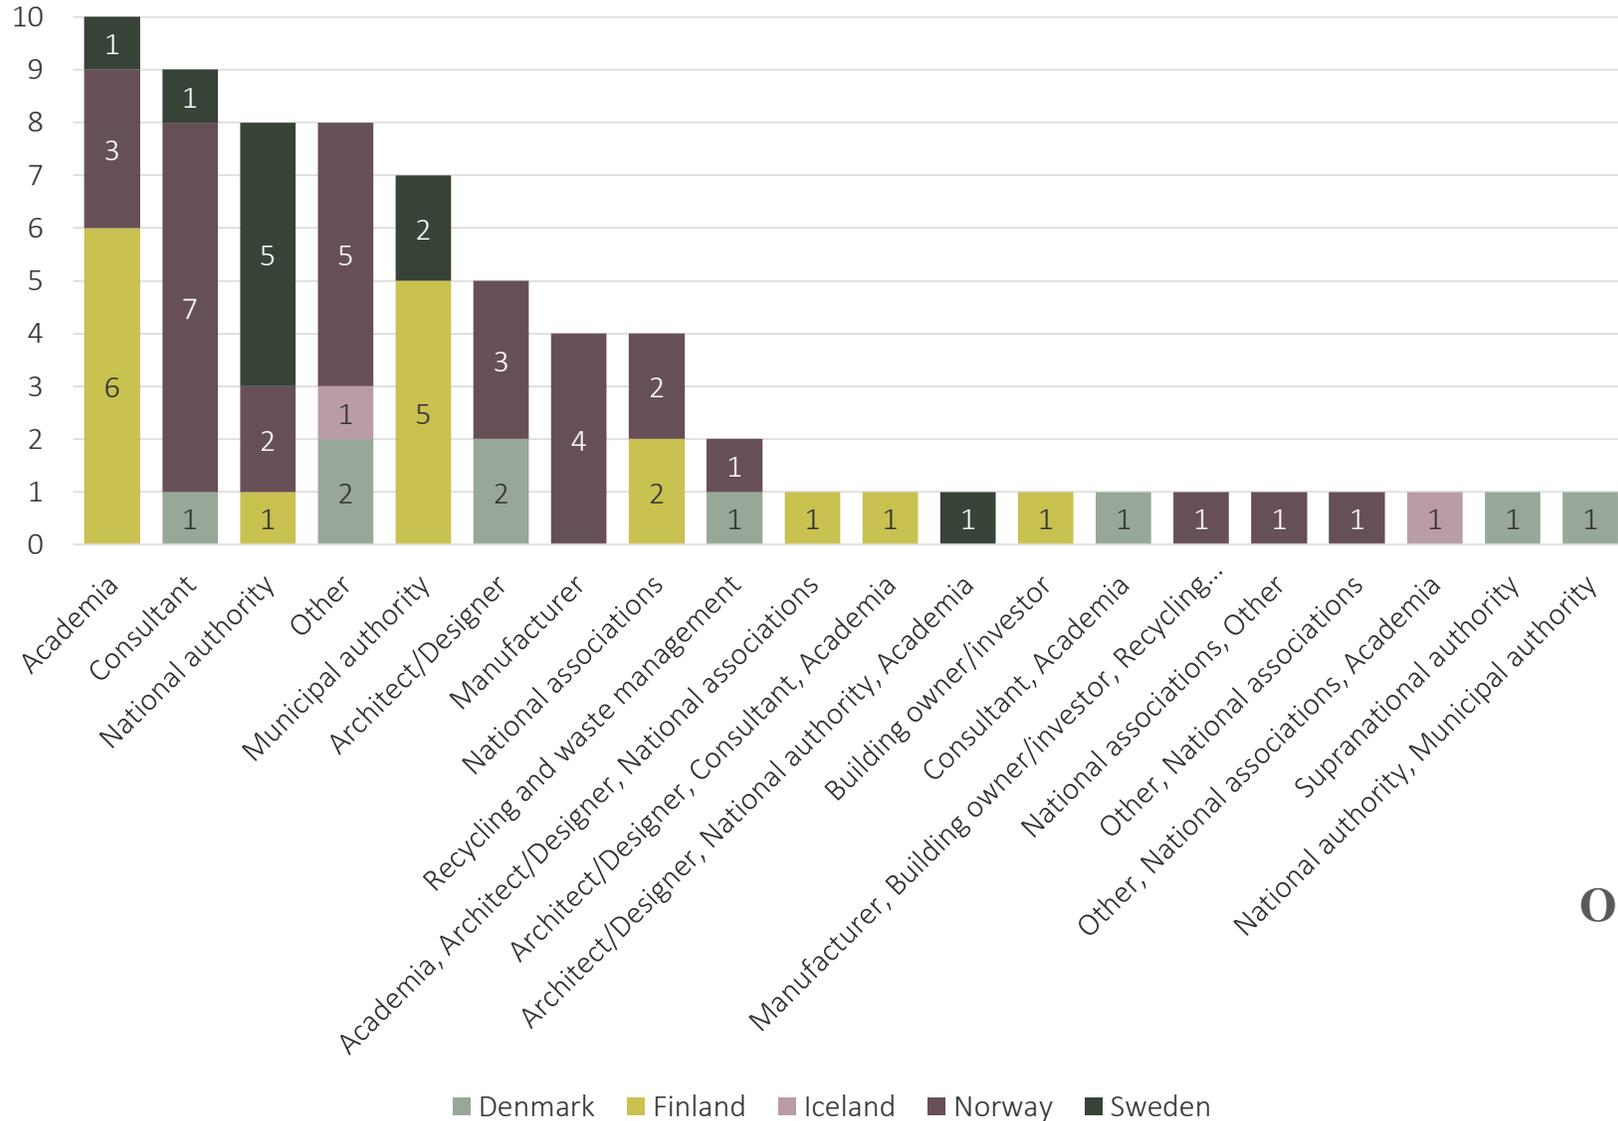

CSDD: value chains

Waste framework directive

Green Claims Initiative

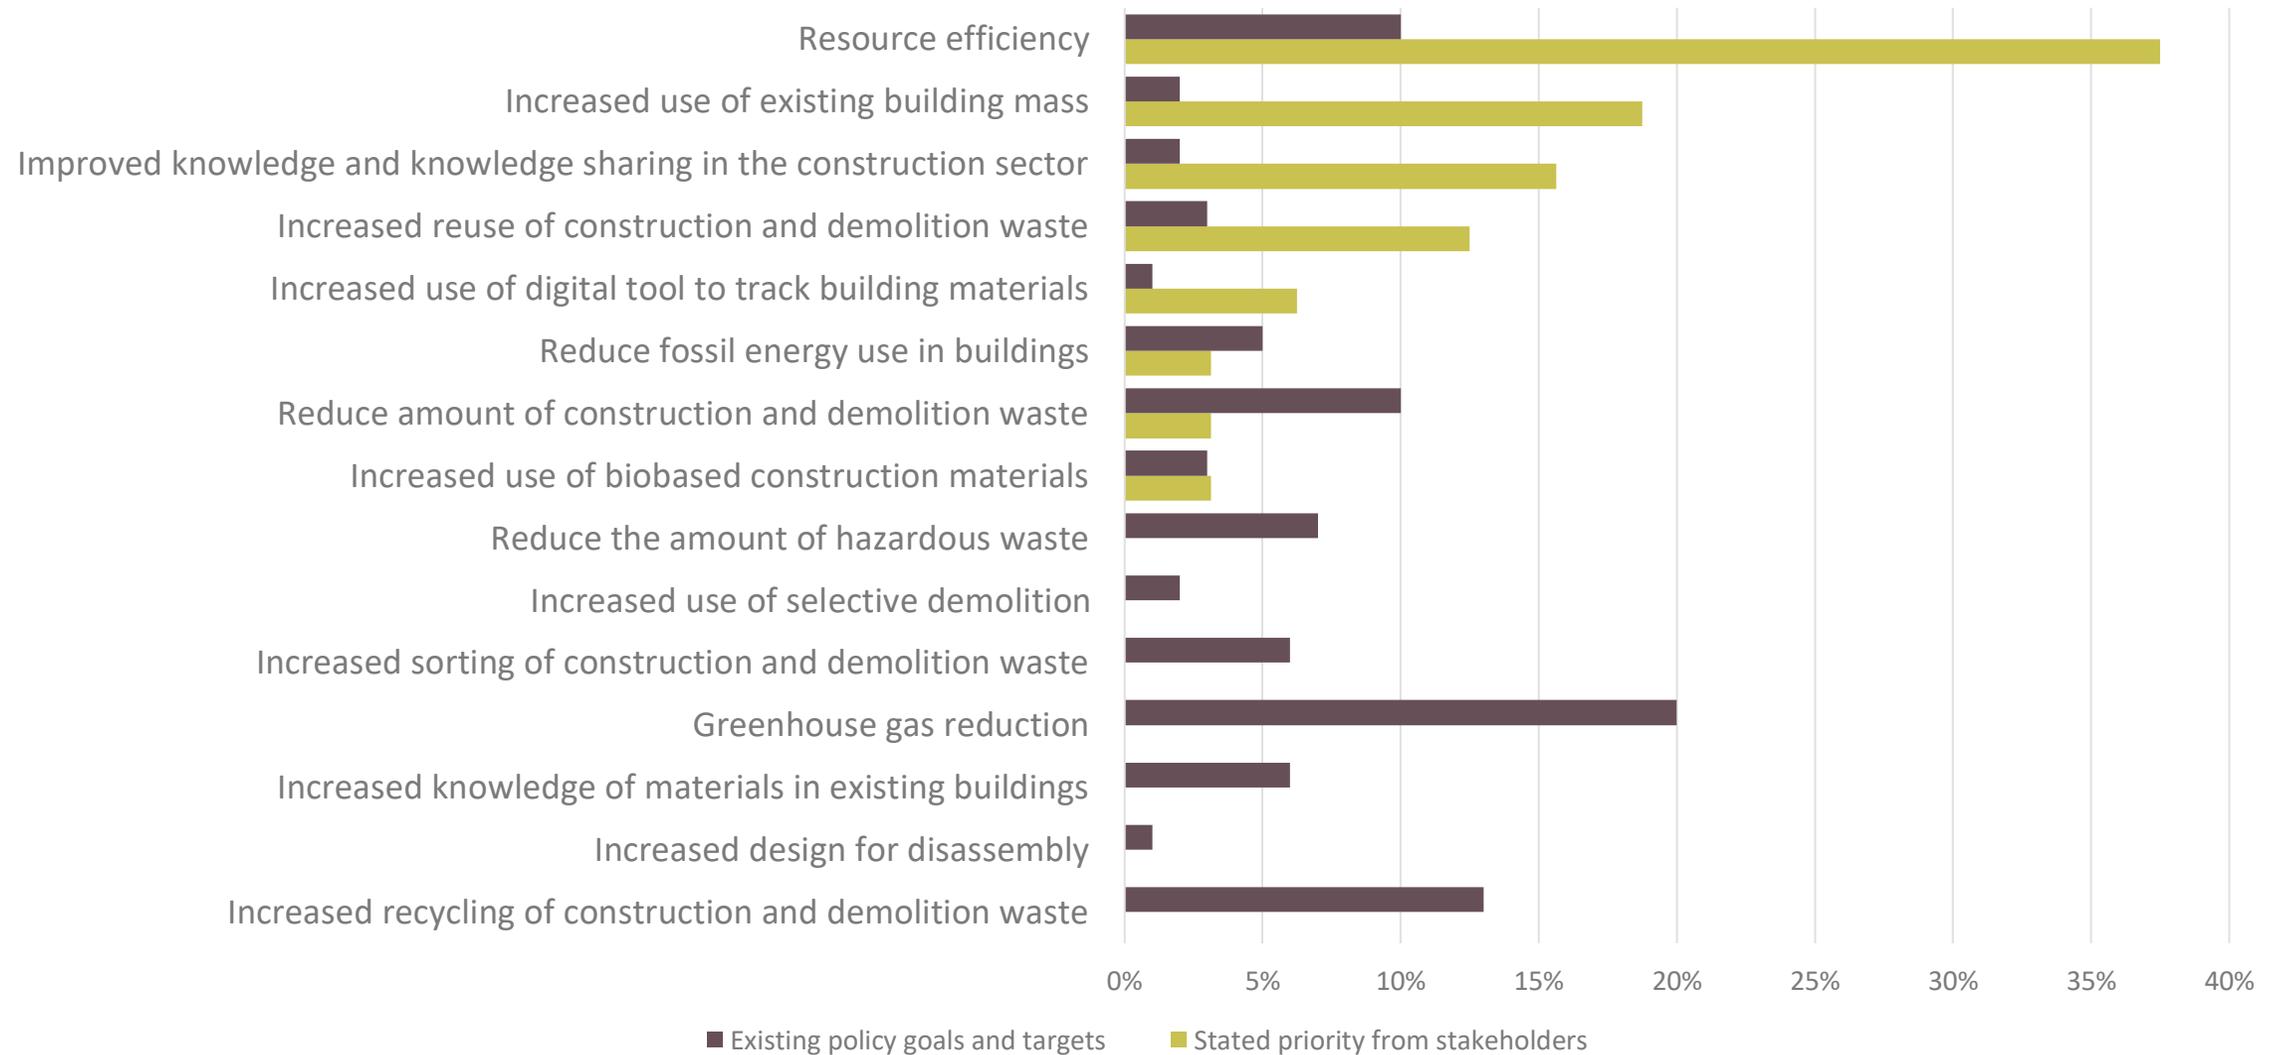

Voluntary schemes and financing opportunities for actual reuse activities

# SIDOSRYHMIEN OSALLISTAMINEN

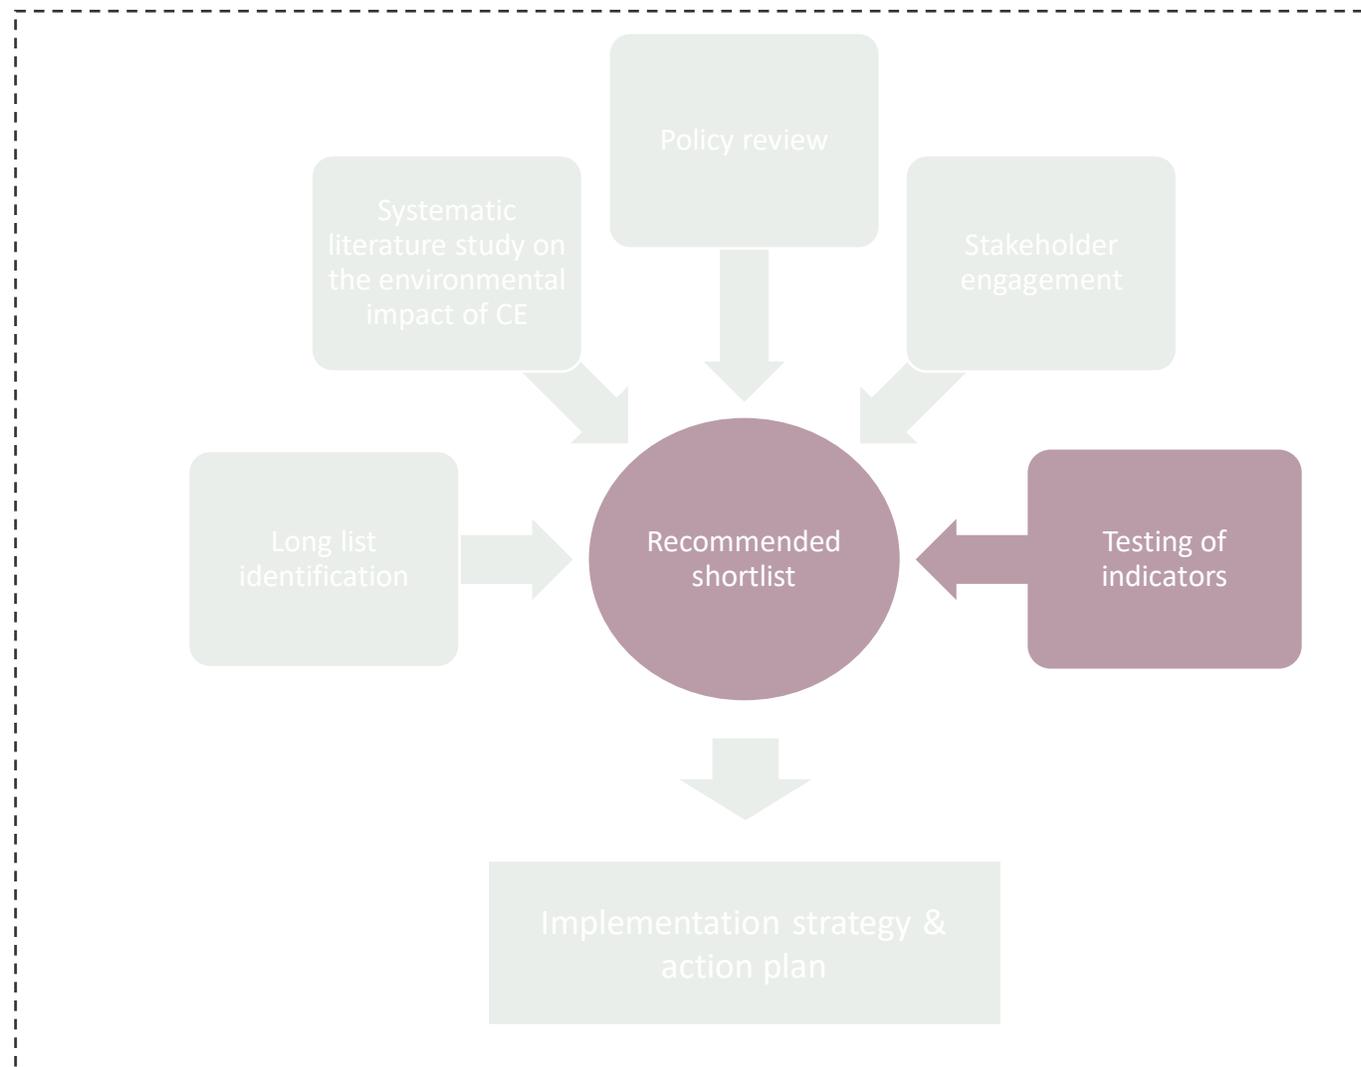

**70 PARTICIPANTS REGISTERED TO ONLINE WORKSHOP**

## Discrepancy between existing Nordic policy goals/targets and stated stakeholder interests

# MITÄ VOIDAAN REALISTISESTI SEURATA

- *mitä ihanteellisesti tulisi seurata,*
- *mitä sidosryhmät katsovat olennaiseksi seurata*
- **mitä voidaan realistisesti seurata**

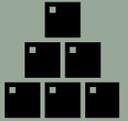

Thematic cluster	Indicators for short term implementation	Indicators for long term implementation
 <b>Utilisation</b>	1 Land use change 2 No. of applications for new construction projects.	3 Utilisation rate of existing building stock
 <b>Renovation</b>	4 Total renovations vs demolition and new buildings	5 Share of rehabilitation projects in line with circular strategies
 <b>Components</b>	6 Number of EPD's for reused materials	7 Life cycle properties of components and materials
 <b>Building projects</b>	8 Share of building projects that are certified 9 Number of EU Taxonomy-aligned buildings (emerging data stream)	10 Life cycle properties of buildings
 <b>Raw materials</b>	11 Resource productivity in construction	
 <b>Waste</b>	12 Construction and demolition waste	13 Proportion of material recycling in relation to total waste
 <b>Energy</b>	14 Carbon footprint of construction	

## THE NNCC INDICATOR FRAMEWORK AND ITS COVERAGE OF R-STRATEGIES AND LIFE CYCLE PHASES.

	1: Land use	2: Building applications	3: Utilisation rate	4: Renovations vs demolition	5: Life cycle properties of rehabilitation projects	6: Number of EPDs for reused materials	7: Life cycle properties of components and materials	8: Certified building projects	9: EU Taxonomy-aligned buildings	10: Life cycle properties of buildings	11: Resource productivity	12: Construction and demolition waste (CDW)	13: Recycled CDW	14: Carbon footprint	
<b>RACER average score: (Rated from 1-7)</b>	tba	tba	4,88	4,98	4,02	5,06	4	4,44	5,64	4,12	3,9	4,82	4,62	4,62	
<b>2) Product</b> Reuse (R3), Repair (R4), Refurbish (R5), Remanufacture (R6)															Product (A1-A3)
<b>3) Component</b> Reuse (R3), Repurpose (R7)															Construction (A4-A5)
<b>1) Function</b> Refuse (R0), Rethink (R1), Reduce (R2)															Use (B1-B5)
<b>4) Material</b> Recycle, downcycle (R8)															End of life (C1-C4)
<b>5) Embodied Energy</b> Recover (R9)															Beyond the system (D)
<b>6) Reference</b> e.g. waste generation															

*THE NNCC INDICATOR FRAMEWORK AND ITS COVERAGE OF THEORY OF CHANGE AND LEVEL OF IMPLEMENTATION*

		1: Land use	2: Building applications	3: Utilisation rate	4: Renovations vs demolition	5: Life cycle properties of rehabilitation projects	6: Number of EPDs for reused materials	7: Life cycle properties of components and materials	8: Certified building projects	9: EU Taxonomy-aligned buildings	10: Life cycle properties of buildings	11: Resource productivity	12: CDW	13: Recycled CDW	14: Carbon footprint	
Processes are activities, e.g., policy responses, workshops, collaborations	Process															Micro
Outputs are the results of processes, e.g., number of workshops. They may or may not lead to outcomes.	Output															Meso
An outcome may represent a change in a group of people or organizations such as increased reuse or recycling.	Outcome															Macro
The impact is the long-term effects on the environment, society and the economy.	Impact
